b) For a homogenous earth dam 50 m high and 2 m free board, a flow net was

constructed. The number of equipotential drops and flow channels obtained

were 25 and 4 respectively. The dam has horizontal filter of 40 m length at its downstream end. Calculate the discharge per meter length of the dam if coefficient of permeability of dam material is  $3\times10^{-3}$  cm/sec

Q5 a) Explain HRB classification of soil.

- (5) (5)
- **b)** A soil sample has a porosity of 40%. The specific gravity of solids is 2.70. Calculate (a) void ratio (b) dry density (c) unit weight if the soil is 50% saturated and (d) unit weight if soil is completely saturated.
- Q6 a) What do you mean by pore pressure? Find the effective pressure in a submerged soil mass. (5)
  - b) What is permeability? Explain falling head permeability test.

(5) (10)

- The water table in a deposit of sand 8 m thick is at a depth of 3 m below the surface. Above water table, the sand is saturated with capillary water. The bulk density of sand is 19.62 kN/m³. Calculate the effective pressure at 1 m, 3 m, and 8 m below the surface . Hence plot the variation of total pressure, neutral pressure and effective pressure over the depth of 8 m.
- Q8 Write short answer on any TWO:

 $(5 \times 2)$ 

- a) Index properties of soil
- b) Shrinkage and swelling of soil
- c) Triaxial test.
- **d)** Friction circle method.
